Morbidity and Mortality

Weekly Report

U. S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE PUBLIC HEALTH SERVICE

Prepared by the

COMMUNICABLE DISEASE CENTER

633-3311

For release November 27, 1964

ATLANTA, GEORGIA 30333

Vol. 13, No. 47

PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED NOVEMBER 21, 1964

EPIDEMIOLOGIC NOTES

ENCEPHALITIS

There were 31 cases of primary infectious encephalitis reported this week bringing the cumulative total of cases to 2,978 thus far this year. Two of this week's cases were reported from New Jersey and they represent delayed reports. There are no known current epidemics of arthropod-bome encephalitis, and the Houston, Texas, and New Jersey outbreaks have ended.

Reports concerning cases of encephalitis in Wisconsin and Indiana, believed to be caused by California encephalitis virus, are included in this issue.

PLAGUE

There have been no cases of human plague reported in the United States thus far this year. Last year, 1 fatal case was reported from New Mexico in a 28-year-old Indian male.

The following table summarizes the number of reported cases of plague in the United States during the past decade.

Year	No. of Cases	Year	No. of Cases
1954	0	1959	4
1955	0	1960	2
1956	Secretary was	1961	3
1957	MEER 1 300	1962	0
1958	0	1963	17.5

CALIFORNIA VIRUS ENCEPHALITIS - Wisconsin

Recent activity of California Encephalitis virus in Wisconsin has been reported from the Zoonosis Research Laboratory at the Wisconsin State Laboratory of Hygiene. Serologic surveys have revealed between 10 and 41 percent of persons studied have antibody to California Encephalitis virus. Degree of outdoor exposure appeared related to development of antibody.

Eleven serologically confirmed cases of encephalitis due to California Encephalitis virus have been reported since 1960. Hemagglutination-inhibition and mouse neutralization tests have been carried out on 351 serum samples sent to the Wisconsin State Laboratory between 1960 and 1964 from patients suspected of central nervous

system infections, and which were negative to all routine diagnostic antigens. Eleven patients showed a fourfold or greater rise in HI antibody titer to California Encephalitis virus between their acute and convalescent phase sera.

Five of the cases occurred in 1960, 2 in 1961, 1 in 1963 and 3 in 1964. Seven of the cases were male and 4 female. The ages of the patients ranged from 6 months to 11 years, and resided mainly in rural areas of western Wisconsin. Clinically all patients had fever, 9 complained of headache, 8 experienced nausea and/or vomiting and the same number had stiff neck. Six of these patients exhibited lethargy and 5 suffered convulsions; only 1 exhibited incoordination. (See table below)

The California Encephalitis virus has been isolated from the brain of a fatal case of encephalitis which occurred in 1960 and the tissue frozen since that time. The isolation was done at the Zoonosis Research Laboratory of the Wisconsin State Laboratory of Hygiene by Dr. Wayne Thompson and was confirmed by Dr. Ralph Anslow, Veterinary Science Department, University of Wisconsin, and Dr. Wm. McD. Hammon, University of

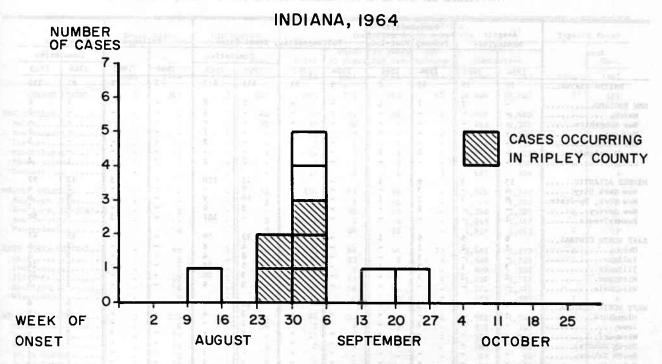

Pittsburgh School of Public Health. The identity of the isolate as a California group virus was confirmed at CDC. (Reported by A. S. Evans, M.D., Director, State Laboratory of Hygiene, Laboratory of the Wisconsin State Board of Health, Dr. Wayne Thompson, Chief, Zoonosis Research Laboratory, Wisconsin State Laboratory of Hygiene, and Dr. Robert Hanson, University of Wisconsin Veterinary Science Department.)

ENCEPHALITIS - Indiana

During the late summer and early fall a number of cases of suspected encephalitis occurred in southeastern Indiana. A total of 10 cases have thus far been serologically confirmed as California Encephalitis. As shown in the figure below, the first case occurred in mid-August. A peak was observed during the last week of August and the first week of September with 2 and 5 cases, respec-

tively. Single cases occurred during each of the last two weeks of September. Five of the cases occurred in Ripley County, the remainder were scattered through 3 counties in southeastern Indiana. The Ripley County cases all occurred during the weeks ended August 29 and September 5. All cases occurred in children between the ages of 4 and 16 years. Nine of the ten cases were in males.

CASES OF ENCEPHALITIS DUE TO CALIFORNIA VIRUS BY WEEK OF ONSET

Efforts were made to collect mosquitoes during late October; however, the advent of cold weather prevented collection of adequate numbers for study.

Serologic investigation of encephalitis cases occurring

in the same area during the previous five years is currently underway in an effort to further delineate the problem. (Reported by Dr. A.L. Marshall, Jr., Director of Preventive Medicine, State Board of Health, Indianapolis, Indiana.)

LEPTOSPIROSIS - North Carolina

A 33-year-old male meat packing-house worker contracted leptospirosis in Stantonburg, North Carolina. The onset of his illness was October 4 when he noted a sore throat and had chills and fever to 103° F. He consulted a private physician who treated him with penicillin for 5 days. On October 10, the fever and chills recurred and was associated with headache and general malaise. The following day he noted a stiff neck. He was admitted to a local hospital on October 12.

On admission to the hospital, nuchal rigidity was described, but no jaundice, conjunctivitis or organomegaly noted. The urinalysis and peripheral white blood count were within the normal range. A lumbar puncture revealed 13 white cells, 12 of which were polymorphonucleocytes. Serum leptospiral agglutination tests were positive with 5 antigens, the strongest being Leptospira icterohemorrhagiae which was positive to a 1:40 dilution. The patient improved and was discharged October 17, feeling well.

At the packing-house, the patient eviscerates beef cattle. He has had this job since March 1961. During the

evisceration procedure, the beef bladder, frequently full of urine, is punctured and sometimes spills over him. (Reported by Jacob Koomen, Jr., M.D., M.P.H., Assistant State Health Director, North Carolina State Board of Health, and an EIS Officer.)

INTERNATIONAL NOTES

Yellow Fever

In 1963, the total number of yellow fever cases reported to the World Health Organization for the whole world amounted to 144 cases and 75 deaths. In 1962, 62 cases and 57 deaths were reported. The increase in world incidence since 1962 was reflected by the 81 cases reported by Bolivia.

Apart from 3 cases reported by Ghana, all the 1963 cases were observed in South America, and were comprised solely of jungle yellow fever. All countries of that continent which reported cases in 1963 also reported cases in 1961 or 1962.

(International Notes continued on back page)

DEATHS UNDER ONE YEAR OF AGE IN IOS U.S. CITIES

(See table page 419)

INTERNATIONAL NOTES

(Continued from page 415)

In Bolivia, the number of cases reported was much larger than in previous years. They occurred in the center of the country and in the west; in both cases, in the basin of tributaries of the Amazon. In Peru, cases occurred in valleys of tributaries of the Amazon. In Colombia, some of the infected areas were in the valley of the Magdalena which flows north into the Atlantic; cases also occurred there in 1962.

Yellow Fever: Cases and Deaths Reported to WHO in 1963

Africa	Cases	Deaths
Ghana	3	3
America		
Bolivia	81	12
Colombia	10	10
Peru	49	49
Venezuela		1
Total	144	75

(Abstracted from the Weekly Epidemiological Record of WHO, November 13, 1964.)

THE MORBIDITY AND MORTALITY WEEKLY REPORT, WITH A CIRCULA TION OF 12,000 IS PUBLISHED BY THE COMMUNICABLE DISEASE CENTER, ATLANTA, GEORGIA 30333.
